

MARKETING
MOJITO

Web Developer Intern Assignment

www.marketingmojito.com

WHY ARE YOU DOING THIS?

● Objective

Your goal is to demonstrate not just your ability to “build what is asked”, but to think like a front-end developer: clean structure, responsiveness, and attention to detail in both code and design.

● Brief

As a shortlisted candidate for the Web Developer Intern position at Marketing Mojito, we would like to provide you with a practical assignment that will allow us to assess your abilities in frontend development and React. This assignment consists of a React-based mini application. We will provide you with the necessary content, logo, and colour scheme.

CONQUER THE CHALLENGE

● The Assignment: Expense Tracker App

Build a simple personal Expense Tracker using React that lets users log, categorise, and manage their expenses — with a live currency conversion feature powered by a public API.

● Requirements:

1. Core Functionality

- Allow users to add a new expense by entering a name, amount, and category (e.g. Food, Travel, Marketing, Utilities, Other).
- Display all added expenses as a list or card-based layout, showing the name, category, amount, and a delete button to remove the entry.
- Show a running total of all expenses that updates automatically as entries are added or removed.
- Show a breakdown of spending by category (e.g. "Food: \$120 — Travel: \$45").
- Fetch a live currency exchange rate from a free public API (such as ExchangeRate-API or Frankfurter.app) and display a real-time conversion preview — for example, showing the total in a second currency of the user's choice via a simple dropdown (USD, EUR, GBP, INR, etc.).

2. Technical Requirements

- Use React (Create React App, Vite, or Next.js — keep it simple).
- Use a component-based structure with at least 4 meaningful components (e.g. ExpenseForm, ExpenseList, SummaryPanel, CurrencyConverter).
- Manage all state using React hooks (useState, useEffect). No third-party state management libraries.
- Handle API loading and error states — do not let the UI break or show blank space if the API call fails.
- Style using plain CSS, CSS Modules, or Tailwind. Do not copy pre-built UI kits or templates.

FOLLOW THE INSTRUCTIONS

● Focus Areas

- Is the interface intuitive to use without any instructions?
- Does the layout feel visually consistent — spacing, typography, and colour used deliberately?
- Does nothing break, overflow, or look misaligned at mobile width?
- Are your components clean, reusable, and sensibly named?
- Are loading and error states handled gracefully throughout?

● Submission Guidelines

You can submit your assignment in the following way:

1. React App

- Live URL (Vercel/Netlify, etc.)
- GitHub repository link

2. Brief Note (Optional but Recommended)

A short note (200–300 words) describing:

- What you built
- What API you used in the React app
- Any challenges you faced and what you would improve with more time

3. Responsiveness

The app should be responsive for at least the following resolutions:

- 1600px x 900px
- 414px x 749px (mobile view)

4. Deployment

- Deploy the app using any free hosting service such as Vercel or Netlify.
- Ensure the live link is publicly accessible.

FOLLOW THE INSTRUCTIONS

● Instructions

1. Do not copy & paste complete projects or layouts from sources like W3Schools, CodePen, Envato, or pre-built templates. We want to see your understanding.
2. You are required to set up your own hosting/deployment for the React app (e.g., Vercel/Netlify).
3. Use valid, clean, and secure coding practices throughout the test.
4. Ensure both the React app is publicly accessible when you submit.

Recommended time to complete the assignment: 48 Hours from the moment you receive this brief.

● Important Note

This test assignment is designed purely for assessment purposes and is not directly related to any live client project.
